

Pulling from the Frame Github Repository

There are two methods to retrieving files from a Github repository, accessing them through a web browser and retrieving them through a command line.

To access through the web browser:

1. Navigate to <https://github.com/AdamWorthington/Frame>
2. Select the document/code that is to be downloaded
3. Click "View Raw"

To access through a command line:

1. First make sure you have added the remote repository on your local machine, run "git remote" to display all repositories.
2. If the repository for Frame is not there, run
"git remote add Frame <https://github.com/AdamWorthington/Frame>"
3. Once you have your local repository set up, the command "git pull Frame" will fetch and merge all files necessary.
